ABSTRACT

The project titled Restaurant Ingredient Inventory System (RIIS) for monitoring and controlling the food ingredient in a restaurant. The project " Restaurant Ingredient Inventory System (RIIS)" is developed in Laravel, jQuery and phpMyAdmin, which mainly focuses on basic operations in a Restaurant Ingredient Inventory System.

The "Restaurant Ingredient Inventory System (RIIS)" is a Windows application designed for 64-bit computers, making it easy to manage and organize inventory. Its user-friendly and visually appealing interface is suitable for both beginners and experienced users. The system offers features for searching and adding data, notification function.

CHAPTER 1 INTRODUCTION

1.1 INTRODUCTION

Our Inventory system project is a basic yet really useful project. Our program allows sellers to quickly evaluate which meals are selling well and which are more profitable. Restaurant employee can use our website to check, and the software will show separate part like which ingredients is more quantity a section and another section is for less quantity the reason that we build this project because most of the restaurant has started to use app or website to record material for the restaurant and during our research our team leader has receive a request from his boss which are also a restaurant owner that she wanted a inventory system that can record material from stock because now the restaurant currently is facing stock, sometime lag of material and lag of count material so that may cause some the customer will face some bad experience eating there and it will make the restaurant image, review online and the become negative and it will also reduce of the efficiency in serving food to customer.

1.2 PROBLEM STATEMENT

In this project we have some important issues to solve before making our ideal become true

- 1) Checking stock is very challenging/Miss count
- 2) Checking Stock Quantity is troublesome for seller in rush hour
- 3) When a restaurant has a large number of orders, taking orders one at a time, the needed ingredient can't be refill at time

1.3 PROJECT SCOPE

Our team start doing this project, we have made some planning first to confirm what benefits that our project can bring. Doing a final project requires a lot of preparation and teamwork, such as to test our knowledge and our understanding about all the things we have learned.

- Superadmin Module
- 1. Manage ingredient and food categories
- 2. Manage ingredients, food items, add-ons and staff
- 3. Manage ingredients used in both food and add-on items

1.4 OBJECTIVE

The goal of this project is to help restaurants efficiently manage their inventory, reduce waste, and prevent stockouts by providing real-time tracking and low-stock alerts. The system will streamline stock monitoring, making it easier for restaurant staff to keep track of ingredients, avoid overstocking, and minimize spoilage. It will also be improving decision-making for purchasing and inventory management.

CHAPTER 2

FUNCTION & USABILITY

- **User role: Superadmin and Admin**

1. Top 10 ingredient stock consumption
2. Sales trend
3. Current month revenue
4. Current month total refill amount
5. Low stock item list
6. Import daily sale excel file
7. View, edit profile detail
8. Ingredient category list
9. Add, edit, delete ingredient category
10. Ingredient stock list
11. Add, edit, delete ingredient stock
12. View ingredient stock refill history
13. Refill stock (Quantity/Weight)
14. Food category list

15. Add, edit, delete food category

16. Food menu

17. Add, edit, delete food

18. Add, delete food ingredient

19. Add-on list

20. Add, edit, delete add-on

21. Add, delete add-on ingredient

22. Daily sale list

23. Manual to add, edit daily sale

24. Stock refill history list

25. Staff list

26. Add, edit, delete staff

CHAPTER 3

SOFTWARE AND HARDWARE COSTING

2.1 SOFTWARE USED AND COSTS

NO	SOFTWARE	COST
1.	Microsoft Office Word 2024	RM609.00
2.	Microsoft Office Excel 2024	
3.	Microsoft Office Power Point 2024	
4.	Chatgpt	-
5.	Laragon	-
6.	Apache HTTP Server	-
7.	MySQL Server	-

Table 2.1

NO	HARDWARE	COST
1.	Laptop	RM2400.00
2.	Printer	RM300.00
3.	Logitech Mouse	RM50.00

Table 2.2

SOFTWARE COST	HARDWARE COST	TOTAL COST
RM609	RM2750	RM3359

CHAPTER 7 CONCLUSION

By streamlining inventory management, our project helps restaurants save time and make better decisions about purchasing and stock levels. This not only improves day-to-day operations but also helps reduce costs and waste.

Working on this project taught us a lot about solving real-world problems and building systems that meet industry needs. In the future, we hope to add more features, like advanced data analysis and supplier integration, to make the system even more useful for restaurants.

Overall, this project shows how technology can make managing a restaurant more efficient and effective.
